APPLICATION PROCESS

Note: Always test before full production. Surface material, texture, and temperature can affect adhesion. Make sure your work area is clean and at room temperature (65–80 °F) for best results. The adhesive is considered permanent and will be difficult to remove once applied.

1	Preparing the Surface <ul style="list-style-type: none">- Ensure the surface is completely clean and dry.- Remove dust, dirt, oils, and residue.- Allow the surface to fully dry before applying the label.	
2	Remove the Back Protective Carrier Sheet <ul style="list-style-type: none">- Carefully peel off the back liner to expose the adhesive.- If the liner is difficult to remove, lightly score an empty area (not over the label) to create a crack and peel.- Avoid cutting or pressing too deep. You only want to cut through one layer of protection.	
3	Position the Label <ul style="list-style-type: none">- The adhesive will dry over time.- Align the label on the desired area.- Once adhesion begins, repositioning may not be possible without damaging the label or surface.	
4	Apply the Label <ul style="list-style-type: none">- Starting from the center, apply firm, even pressure outward to remove air bubbles.- Use a squeegee or soft cloth to smooth the label and ensure full contact.- Keep the label taut to prevent wrinkles during application.- Apply steady, consistent pressure across the surface for best results.	
5	5) After Application <ul style="list-style-type: none">- Allow at least 24 hours for the adhesive to cure fully before exposing to moisture, friction, or handling.
